Week 10

Presenting to Different Audiences

Jonathan A. Pedroza (JP) PhD

2026-10-27

Check-ins

- Spreadsheet here

Why Tailor Presentations?

- Similar to my slides, you will probably bore people
- Academics get taught how to talk to researchers and other academics
  - Many are terrible at working with stakeholders outside of academia
  - Many researchers see journals, conferences, and funding reports as dissemination

Implementation & Dissemination

- Entire field on how researchers can assess/study those implementing interventions/etc. and sharing findings
  - Using standardized materials you can evaluate the effectiveness of practitioners implementing something you are interested in
  - Entire theoretical frameworks around this topic
    - RE-AIM website
- Dissemination on how to share research findings in ways that reach your target audience
  - There is a lot of literature on this field

Think About Who Will Come Up To Your Poster

- Would you explain your project in the same manner to the general public as you would
- Students?
- Postdocs?
- Staff?
- Faculty?

Questions You Might Receive

- Why does this matter?
- What is the point of this study?
- Why did you do *this* instead of *that*?
- Why didn't you have AI do this?
- Tell me why I should care.
- These are all questions/comments I have received
  - Can you respond in a single sentence?

Dissemination Adapted for Posters

- Create a dissemination plan to address:
  - Purpose of disseminating research
  - Audience
  - Key message to be shared (takeway for anyone)
  - Methods for dissemination (materials/activities)
  - Timing of dissemination
  - Process of evaluating success of dissemination

For Academics

- What is the problem you wanted to address
- Talk about the background literature
  - What informed your research idea
- Transition to your RQs
- Give me brief overview of methods
- Takeaways for the findings
  - This is more a poster design topic
- Discussion
  - Flip it around with questions for audience
  - Next steps and areas for collaboration

Stakeholders

- Problem statement
  - Why did you do your study?
  - What is the big picture answer to why you did the study
  - Why does this research matter *past* academia
- Who is affected
- What decisions can be made from the findings
- How are you extending the reach of this study?

Practitioners

- Problem being addressed
- What you did (methods) at a high level
  - Technical jargon loses interest
- Takeaways
- Discussion points
  - What can they tell clients/staff/managers/stakeholders

General Public

- Can you explain the complicated parts of your research/methods in as simple of terms as possible
- Analogies are your friend
- Be prepared for comments that may not be directly related to your research
  - How do you direct that to come back into

Practice Makes Perfect

- I know most of you will not practice your presentations
- Reason for having small group presentations
- Practice your presentation multiple times before giving it to a group
  - Transitions can be useful but you need to know where they are in your slides
- Time yourself on specific sections

For Presentations Next Week

- Have slides (to both submit and present)
- Think about what audiences will show up at your poster
  - Sell us your research project
- Have your elevator pitch ready
- When you finish your presentation, think of weak areas
  - That is where your questions will come up

Example Presentations

- Create a title for your presentation
  - Keep it under 12-15 words
- Elevator Pitch
  - Problem statement (no time for background information)
    - "This is a problem and it has be examined before; however, there is a gap..."
  - Your purpose statement/aim(s)/RQs/hypothesis(es)
  - What you are doing in your study (Methods)
  - What are you hoping to find?
- Someone in each group will time each elevator pitch

Example Presentations

- Walk audience through your project
- Present your background information
- Show how you came to your RQs
- State what the purpose of your research is

Example Presentations

- Cover everything for your methods
  - Be as thorough as possible
- If you are unsure about your methods, propose multiple methods
  - Get feedback on pros and cons

Example Presentations

- Audience is responsibe for each asking questions and offering feedback
  - These will serve as your assignments as feedback
  - I will configure how to leave comments on the presentation through bcourses
- The point of this is to help find gaps in each other's research projects
- If something is not clear, ask for clarification

Disseminating Your Project

- I like this research study on innovative dissemination
  - Partially because they give a list of rules and that means less reading for me

Think About Disseminating Results Beyond the Poster

- Disseminate to the public
  - LinkedIn
  - Website portfolio
  - Twitter/BlueSky/Mastodon
- Change how you present methodology and findings

Rules of Dissemination

1. Get the Basics Right
   - Define objectives, map audience, frame message
2. Keep the Right Profile
   - Use social media + personal website to expand on research
3. Encourage Participation
   - Open source, invite others for collaboration
4. Open Science for Impact
   - Open access pubs/preprints, publish datasets
5. Remix Traditional Outputs
   - Blog posts in addition to research papers

Rules of Dissemination

6. Go Live
   - Talk about your research in less common areas
7. Think Visual
   - Use art or multimedia interpretations
8. Respect Diversity
   - Reach should be inclusive
9. Find the Right Tools
   - Use tools that will be most effective for disseminating your work
10. Evaluate, Evaluate, Evaluate
    - Assess your dissemination activities
    - What works? Why doesn't something work?

Data H195B

- Course: DATA H195B
- Day: Mondays
- Time: 3:30–5:00 p.m.
- Location: Gateway, Room B1012
- Instructor: Narges Norouzi
- Semester: Spring 2027
